To whom it may concern,

I am a specialist AML clinician involved in the treatment of transplant patients, with a particular interest in clinical trials and ensuring that patients receive the best possible therapy.

I recently had the opportunity to see a demonstration of the **Heme.io** platform at our recent AML Academy, and I was incredibly impressed by its capabilities. The system's ability to navigate complex diagnostic algorithms — particularly from free text, which is often challenging to interpret and typically drawn from multiple disparate sources — is exceptional.

By using intelligent algorithms to integrate and interpret this information, **Heme.io** makes the diagnostic process both more straightforward and considerably more accurate than traditional approaches. This represents a major step forward in haematological diagnostics.

Accurate diagnosis forms the absolute bedrock of effective therapy, and I believe **Heme.io** has the potential to revolutionise the quality of care that patients receive. I am genuinely excited to see how this platform continues to develop and how its wider implementation could support clinicians in delivering more precise and timely treatment across the country.

Yours sincerely,

Dr John Chadwick
